## ECO 209Y

## Macroeconomic Theory and Policy

## Lecture 10: Neo-Keynesian View on Money and Banking

## The Neo-Keynesian Determination Of The Money Supply

- Following Keynes, we have assumed that the money supply was an exogenous variable (determined by the central bank)
$>$ But the central bank does not set $\mathbf{M}$ directly
- According to the Neo-Keynesian theory, $\mathbf{M}$ is determined by the interaction among the central bank, the commercial banks, and the public (households and firms)
$>$ Therefore, $\mathbf{M}$ is seen as an endogenous variable

■ For simplicity, we will consider the M1 definition of money supply: $\mathbf{M}=\mathbf{C U} \mathbf{P}+\mathbf{D}$
$>$ Therefore, anything that affects $\mathbf{C} \mathbf{U}_{\mathbf{p}}$ and/or $\mathbf{D}$ will affect $\mathbf{M}$

## The Role of the Public

$$
M=C U_{P}+D
$$

- The public has a role in the determination of the money supply because their demand for currency affects $\mathbf{C U}_{\mathbf{p}}$
- The public also determines jointly with the commercial banks the level of deposits (D)
- What is important from the point of view of the public is thus the currency-deposit ratio:

$$
\mathrm{cu}=\mathrm{CU}_{\mathrm{p}} / \mathrm{D}
$$

## The Role Of the Commercial

 BANKS$$
M=C U_{P}+D
$$

- As we have seen, the commercial banks determine jointly with the public the level of deposits (D)
- The role of the commercial banks in the determination of the money supply is summarized by the (desired) cash reserve ratio:

$$
r e=R / D
$$

- Cash reserves ( $\mathbf{R}$ ) consists of the currency the commercial banks hold in their vaults $\left(\mathbf{C U}_{B}\right)$ and deposits they hold at the Bank of Canada ( $\mathrm{D}_{\mathrm{CB}}$ ):

$$
\mathrm{R}=\mathrm{CU} \mathrm{~B}_{\mathrm{B}}+\mathrm{D}_{\mathrm{CB}}
$$

## The Role of Cash Reserves

## $\mathrm{R}=\mathrm{CU}_{\mathrm{B}}+\mathrm{D}_{\mathrm{CB}}$

- Commercial banks hold cash reserves ( $\mathbf{R}$ ) in order to meet:
> Their customers' demands for currency
$>$ Payments their customers make by cheques (or debit) which are deposited in other banks
- The commercial banks can determine the cash reserve ratio (re) they consider optimum and thus they can determine (jointly with the public) the level of deposits (D)
> In this way, commercial banks can affect the component $\mathbf{D}$ of the money supply

## The Role of the Bank of Canada

- The role of the Bank of Canada in the determination of the supply of money is summarized by the stock of high-powered money or the monetary base (B)
- High-powered money consists of currency (CU) and deposits of the chartered banks at the Bank of Canada ( $D_{C B}$ )

$$
\begin{aligned}
B & =C U+D_{C B} \\
& =\left(C U_{P}+C U_{B}\right)+D_{C B} \\
& =C U_{P}+R
\end{aligned}
$$

- The Bank of Canada cannot determine by itself the component $\mathbf{C U}_{\mathrm{p}}$ of the money supply
- The Bank of Canada can affect $\mathbf{R}$ and most particularly $D_{C B}$, and thus indirectly the level of $\mathbf{D}$

## High-Powered Money and Money SUPPLY

- Assumption: The Bank of Canada controls the supply of highpowered money (i.e., it determines the level of B)
$>$ As we will see later, the Bank can also affect the decisions of the commercial banks regarding the optimum level of re
- The demand for high-powered money comes from the public $\left(\mathbf{C U}_{\mathrm{p}}\right)$ and the chartered banks ( R )
- Assumption: The public has a preferred ratio of currency to deposits (cu = CU $\mathbf{p} / \mathbf{D}$ ) and the banks have a desired ratio of reserves to deposits (re = R/D)
$>$ Therefore, given cu and re, we can estimate the total money stock that can be supported by any given stock of high-powered money

## The Money Multipler

- Assumption: There is a relationship between the stock of high-powered money ( $\mathbf{B}$ ) and the money stock ( $\mathbf{M}$ )
$>$ They are related by the money multiplier (mm)
- By definition, the money multiplier is the ratio of the stock of money to the stock of high-powered money:

$$
\mathrm{mm}=\mathrm{M} / \mathrm{B}
$$

- Given mm and $\mathbf{B}$, then

$$
\mathrm{M}=\mathrm{mm} \mathrm{~B}
$$

- Therefore, given mm, a change in the stock of high-powered money affects the money stock as follows:

$$
\Delta M=m m \Delta B
$$

## Monetary Equilibrium

- Assumption: Suppose that there is equilibrium between the supply and the demand for money

$$
M=C U_{P}+D
$$

- Assumption: Also suppose that there is equilibrium between the supply of high-powered money and the demand for highpowered money

$$
B=C U+D_{C B}=\left(C U_{P}+C U_{B}\right)+D_{C B}=C U_{P}+R
$$

- If these two conditions hold, then there is monetary equilibrium
> People hold the composition of their money balances in the preferred ratio (cu)
$>$ Banks hold just the right ratio of reserves to deposits (re) and $\mathbf{R}$ are held in the right composition

## The Money Multipler

- Given $\mathbf{M}=\mathbf{C U} \mathbf{P}+\mathbf{D}$ and $\mathbf{B}=\mathbf{C} \mathbf{U}_{\mathbf{p}}+\mathbf{R}$, then the money multiplier is:

$$
\begin{aligned}
\mathrm{mm} & =\frac{M}{B} \\
& =\frac{C U_{P}+D}{C U_{P}+R}
\end{aligned}
$$

- And if we divide both the numerator and the denominator by D, we obtain

$$
\mathrm{mm}=\frac{\mathrm{cu+1}}{\mathrm{cu+re}}
$$

## The Money Multiplier (cont’o)

- The size of $\mathbf{m m}$ depends on $\mathbf{c u}$ and re
$>$ That is, it depends on the assumed preferences about the public's and the banks' composition of balances
- The ratio cu is determined primarily by payments habits
- One of the major determinant of re is the Bank of Canada's target of the overnight rate
> The overnight rate is the rate at which banks borrow and lend among themselves for settlement payment purposes

■ Neither cu nor re is fixed $\rightarrow$ and thus $\mathbf{m m}$ is not fixed either $>$ For instance, re changes with the overnight rate and with expectations about the future
$>$ If $\mathbf{m m}$ is not fixed, then M is not exogenous

## Monetary Policy

- The Bank of Canada implements monetary policy by targeting either M or i
$>$ Money supply rule: It targets $\mathbf{M}$ by changing the stock of high-powered money
- Interest rate rule: It targets i by changing its target for the overnight rate of interest
- The Bank of Canada cannot target $\mathbf{i}$ and $\mathbf{M}$ at the same time > If it targets the $\mathbf{M}$, it must allow $\boldsymbol{i}$ to adjust to equate $\mathbf{M}^{\mathbf{S}}$ and $\mathbf{M}^{\mathrm{D}}$
$>$ If it targets $\mathbf{i}$, it must allow $\mathbf{M}^{\mathbf{S}}$ to change until it matches the $\mathbf{M}^{\mathrm{D}}$ at that level of $\mathbf{i}$

## Summary of the Roles of the Public, the Chartered Banks, and the Bank of Canada

$$
M=C U_{P}+D
$$

1) The public determines $\mathbf{c u}=\mathbf{C U} \mathbf{p} / \mathbf{D}$
2) The commercial banks determine re=R/D
3) The Bank of Canada determines:
$>R$ and particularly $\mathrm{D}_{\mathrm{CB}}$ but not $\mathbf{D}$
$>$ The target for the overnight rate but neither re nor $\mathbf{i}$

## The Money Supply Rule

## Liabilities of the Bank of Canada

- The components of high-powered money or monetary base (B) represent a liability in the balance sheet of the Bank of Canada

$$
B=C U_{P}+C U_{B}+D_{C B}
$$

Also recall that $\mathbf{R}=\mathbf{C U}_{\mathrm{B}}+\mathrm{D}_{\mathrm{CB}}$

- Another liability in the balance sheet of the Bank of Canada is Government of Canada's deposits at the Bank of Canada
> However, Government of Canada's deposits are neither part of the monetary base nor of the money supply

## Creation of High-Powered Money

- High-powered money is created when the Bank of Canada acquires assets or reduces its liabilities in the form of Government of Canada's deposits
$>$ When the Bank of Canada acquires assets (e.g., when it buys Government Bonds from the public), it increases its liabilities (and, therefore, the monetary base) by the same amount
> When the Bank of Canada reduces Government of Canada's deposits, it changes the form of liability to highpowered money

## Open Market Operations

- The main means by which the Bank of Canada changes the monetary base is through open market operations
- By open market operations we mean the Bank of Canada purchasing or selling Government Bonds from or to the public or the commercial banks
> An open market purchase will increase the monetary base, and thus the money supply
$\Rightarrow$ An open market sale will decrease the monetary base, and thus the money supply
- The use of this policy instrument to increase the money supply is known as quantitative easing
> Let's look at some illustrations

## Open Market Purchase

| Public |  | Commercial Bank |  |  | Bank of Canada |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Assets |  | Liabilities | Assets | Liabilities | Assets | Liabilities |  |
| GB | -100 |  | $D_{C B}+100$ | D | +100 | GB |  |
| D | +100 |  |  |  | $D_{C B}+100$ |  |  |

- Suppose the Bank of Canada buys bonds from the public in the amount of $\$ 100$ million
- Therefore, since $B=C U_{P}+C U_{B}+D_{C B}$
$\Rightarrow \Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=+100$
- And $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=0+100=+100$

## Bank Lending and the Money Multiplier

- A change in $\mathbf{B}$ affects $\mathbf{M}$ as follows:

$$
\Delta M=m m \Delta B
$$

- We have also seen that

$$
m m=\frac{c u+1}{c u+r e}
$$

- If we assume $\mathrm{cu}=0.25$ and $\mathrm{re}=0.1$, then

$$
\mathrm{mm}=1.25 / 0.35=3.57
$$

- Therefore, if $\Delta \mathrm{B}=+100$, then

$$
\Delta M=3.57(+100)=+357
$$

## Individuals' Money Holdings

- Individuals' total money holdings are $\mathbf{C U}_{\mathrm{P}}+\mathbf{D}$
- The fraction of currency in total money holdings is:

$$
\frac{C U_{p}}{C U_{p}+D}=\frac{c u}{c u+1}=\frac{0.25}{1.25}=0.2 \text { or } 20 \%
$$

- The fraction of deposit in total money holdings is:

$$
\frac{D}{C U_{P}+D}=\frac{1}{c u+1}=\frac{1}{1.25}=0.8 \text { or } 80 \%
$$

## Open Market Purchase (Step 1)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
| GB -100 |  | $C U_{B} \quad-20$ | D +80 | $\mathrm{GB} \quad+100$ | $D_{C B}+100$ |
| $\begin{array}{ll}\text { CU } & +20 \\ \text { D } & +80\end{array}$ |  | $\mathrm{D}_{\mathrm{CB}}+100$ |  |  |  |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=20-20+100=+100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-20+100=+80$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=20+80=+100$
- $\Delta$ Desired Reserves $=+8$

This implies that the actual re is greater than the desired re.

- Excess Reserves $=\Delta R-\Delta$ Desired Reserves $=+72$

## Open Market Purchase (Step 2)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
| GB -100 | L +72 | $\mathrm{D}_{\text {CB }}+100$ | D $\quad+80$ | GB +100 | $\mathrm{D}_{\text {CB }}+100$ |
| $\begin{array}{ll} \mathrm{CU} & +20 \\ \mathrm{D} & +80 \end{array}$ |  | $\mathrm{CU}_{\mathrm{B}}-20$ | D +57.6 |  |  |
| CUP ${ }_{\text {P }}+14.4$ |  | L $\quad+72$ |  |  |  |
| D +57.6 |  | $\mathrm{CU}_{\mathrm{B}}-14.4$ |  |  |  |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=34.4-34.4+100=+100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-34.4+100=+65.6$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=34.4+137.6=+172$
- $\Delta$ Desired Reserves $=+13.76$

■ Excess Reserves $=\Delta \mathrm{R}-\Delta$ Desired Reserves $=+51.84$

## Open Market Purchase

■ As the process continuous and all excess reserves are eliminated, the money stock increases by the full multiplying effect:

$$
\begin{aligned}
& \Delta M=m m \Delta B=3.57(+100)=+357 \\
& \Delta C U_{P}=0.2 \Delta M=0.2(+357)=+71.4 \\
& \Delta D=0.8 \Delta M=0.8(+357)=+285.6 \\
& \Delta L=+257
\end{aligned}
$$

- At the end of the process, the banking system has created \$257 in new money

## Open Market Purchase (Final)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
| GB -100 | +257 | $\mathrm{D}_{\text {CB }}+100$ | D $\quad+80$ | GB +100 | $\mathrm{D}_{\text {CB }} \quad+100$ |
| CU  <br> P +20 |  | $\mathrm{CU}_{\mathrm{B}}-20$ | D +205.6 |  |  |
| D $\quad+80$ |  | L +257 |  |  |  |
| $\begin{gathered} C U_{p}+51.4 \\ D+205.6 \end{gathered}$ |  | $\mathrm{CU}_{\mathrm{B}}-51.4$ |  |  |  |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=71.4-71.4+100=+100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-71.4+100=+28.6$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=71.4+285.6=+357$
- $\Delta$ Desired Reserves $=+28.6$
- Excess Reserves $=\Delta \mathrm{R}-\Delta$ Desired Reserves $=0$

## Open Market Purchase from the Commercial Banks (Step 1)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
|  |  | $G B$ | -100 |  | $G B$ |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=+100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=+100$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=0$
- Excess reserves $=+100$

## Open Market Purchase from the Commercial Banks (Final)

- As the process continuous and all excess reserves are eliminated, the money stock increases by the full multiplying effect:

$$
\begin{aligned}
& \Delta M=m m \Delta B=3.57(+100)=+357 \\
& \Delta C U_{P}=0.2 \Delta M=0.2(+357)=+71.4 \\
& \Delta D=0.8 \Delta M=0.8(+357)=+285.6 \\
& \Delta L=+357
\end{aligned}
$$

- At the end of the process, the banking system has created \$357 in new money

## Open Market Purchase from the Commercial Banks (Final)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
| $\begin{aligned} & C U_{P}+71.4 \\ & D+285.6 \end{aligned}$ | L +357 | $\begin{array}{ll} \hline \mathrm{GB} & -100 \\ \mathrm{D}_{\mathrm{CB}} & +100 \\ \mathrm{~L} & +357 \\ \mathrm{CU}_{\mathrm{B}} & -71.4 \end{array}$ | D +285.6 | $\mathrm{GB} \quad+100$ | $\mathrm{D}_{\mathrm{CB}}+100$ |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=71.4-71.4+100=+100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-71.4+100=+28.6$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=71.4+285.6=+357$
- $\Delta$ Desired Reserves $=+28.6$
- Excess Reserves $=\Delta \mathrm{R}-\Delta$ Desired Reserves $=0$

## Open Market Sale to the Public (Step 1)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
| GB $\quad+100$ |  | $\mathrm{D}_{\text {CB }}-100$ | D -100 | GB -100 | $\mathrm{D}_{\text {CB }} \quad-100$ |
| D -100 |  |  |  |  |  |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-100$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=-100$
- $\Delta$ Desired Reserves $=-10$
- Excess (Insufficient) Reserves $=\Delta \mathrm{R}-\Delta$ Desired Reserves $=-90$

## Open Market Sale (Final)

- Since actual decrease in reserves is greater than the desired decrease, the cash reserve ratio is now below the desired level
$>r e=R / D$
> D must, therefore, decrease (by recalling loans)
- As the process continuous and re returns to the desired level, the money stock decreases by the full multiplying effect:

$$
\begin{aligned}
& \Delta M=m m \Delta B=3.57(-100)=-357 \\
& \Delta M=\Delta C U_{p}+\Delta D=-71.4-285.6=-357 \\
& \Delta L=-257
\end{aligned}
$$

- At the end of the process, the banking system has destroyed $\$ 257$ in money (by recalling loans)

## Open Market Sale to the Public (Final)

| Public |  | Commercial Bank |  | Bank of Canada |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Assets | Liabilities | Assets | Liabilities | Assets | Liabilities |
| GB $\quad+100$ | -257 | $\mathrm{D}_{\mathrm{CB}}-100$ | D $\quad-80$ | GB -100 | $\mathrm{D}_{\text {CB }}-100$ |
| $\mathrm{CU}_{\mathrm{p}}-20$ |  | $\mathrm{CU}_{\mathrm{B}}+20$ | D -205.6 |  |  |
| D $\quad-80$ |  | L - 257 |  |  |  |
| $\mathrm{CU}_{\mathrm{p}}-51.4$ |  | $\mathrm{CU}_{\mathrm{B}}+51.4$ |  |  |  |

- $\Delta \mathrm{B}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=-71.4+71.4-100=-100$
- $\Delta \mathrm{R}=\Delta \mathrm{CU}_{\mathrm{B}}+\Delta \mathrm{D}_{\mathrm{CB}}=+71.4-100=-28.6$
- $\Delta \mathrm{M}=\Delta \mathrm{CU}_{\mathrm{P}}+\Delta \mathrm{D}=-71.4-285.6=-357$
- $\Delta$ Desired Reserves $=-28.6$

■ Excess (Insufficient) Reserves $=\Delta \mathrm{R}-\Delta$ Desired Reserves $=0$

## Impact of Government Borrowing to Cover a Deficit

- When the Government borrows from the public, the money supply doesn't change
> That is, the monetary base doesn't change and thus the money supply doesn't either
- When the Government borrows from the Bank of Canada, the money supply increases
$>$ That is, the monetary base increases and thus the money supply also increases
$>$ In this case, it is said that the Government is monetizing the deficit

## Financing a Deficit by Borrowing from the Public

| Public |  |  |
| :--- | :--- | :--- |
| GB | +100 |  |
| $D$ | -100 |  |
| D | +100 |  |

| Commercial Banks |  |  |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{D}_{\mathrm{CB}}$ | -100 | D | -100 |
| $\mathrm{D}_{\mathrm{CB}}$ | +100 | D | +100 |

| Bank of Canada |  |  |
| :---: | :--- | :--- |
|  | $\mathrm{D}_{\mathrm{G}}$ | +100 |
|  | $\mathrm{D}_{\mathrm{CB}}$ | -100 |
|  | $\mathrm{D}_{\mathrm{G}}$ | -100 |
|  | $\mathrm{D}_{\mathrm{CB}}$ | +100 |

| Federal Government |  |  |  |
| :--- | :--- | :--- | :--- |
| $D_{G}$ | +100 | GB | +100 |
| $D_{G}$ | -100 |  |  |
|  |  |  |  |

When the Government borrows from the public, B decreases and so does M ; and when the Government spends the borrowed money, B increases and so does $M$.

## Financing a Deficit by Borrowing from the Bank of Canada

| Public |  |  |
| :--- | :--- | :--- |
| $D$ | +100 |  |
|  |  |  |

| Commercial Banks |  |  |  |
| :--- | :--- | :--- | :--- |
| $\mathrm{D}_{\text {СВ }}$ | +100 | D | +100 |
|  |  |  |  |

| Bank of Canada |  |  |  |
| :--- | :--- | :--- | :--- |
| GB | +100 | $D_{G}$ | +100 |
|  |  | $D_{G}$ | -100 |
|  |  | $D_{C B}$ | +100 |

| Federal Government |  |  |  |
| :--- | :--- | :--- | :--- |
| $D_{G}$ | +100 | GB | +100 |
| $D_{G}$ | -100 |  |  |
|  |  |  |  |
|  |  |  |  |

When the Government borrows from the Bank of Canada, B increases and so does M .

## ImPACT OF BORROWING FROM THE Public or the Bank of Canada

The money supply doesn't change when the Government borrows from the public. Therefore, income increases to $Y_{1}$.

The money supply increases when the Government borrows from the Bank of Canada. Therefore, income increases further to $Y_{2}$.

## The Interest Rate Rule

## Control of the Rate of Interest

- The Bank of Canada can also affect $i$ and the commercial banks' re by changing a target for the overnight rate
- The Bank of Canada sets the bank rate 8 times a year
$>$ The bank rate is the rate of interest the Bank of Canada charges for loans to commercial banks
> This represents a ceiling for the overnight rate
- The Bank of Canada also accepts deposits from the commercial banks at a 0.5 percent below the bank rate $>$ This represents a floor for the overnight rate
- The target overnight rate is the mid point in this interest rate band, i.e., 25 basis points below the bank rate

## The Bank of Canada and the Rates of Interest

## Control of the Rate of Interest (contio)

■ How does a decrease in the bank rate affect the level of credit in the economy (and thus $\mathbf{M}$ )?

- A decrease in the bank rate decreases the band of the overnight rate, and thus the overnight rate decreases
$>$ A decrease in the overnight interest rate affects the entire spectrum of market interest rates
$>$ A decrease in the overnight rate also affects the desired cash-reserve ratio of the commercial banks
- Therefore, a change in the bank rate affects in two ways the level of credit in the economy (and thus $\mathbf{M}$ )
$>$ That is, by affecting re and $\mathbf{i}$

## Control of the Rate of Interest (cont’d)

- A reduction in the desired cash-reserve ratio:
$>$ As the desired cash-reserve ratio decreases, banks find themselves with excess reserves (i.e., re is too high)
$>$ Banks start lending more money to increase $\mathbf{D}$ and reduce re, and thus the money supply increases
- A reduction in market interest rates:
$>$ As the demand for new loans gradually adjusts, commercial banks may find their actual re falling below the desired level
- Commercial banks need higher cash reserves ( R )
$\Rightarrow$ The commercial banks will then sell government bonds to the Bank of Canada and $\mathbf{R}$ will increase

## Summary: Control of the Money Stock or the Rate of Interest

- The Bank of Canada implements monetary policy by targeting either M or i
- But the Bank of Canada cannot simultaneously target both the $\mathbf{i}$ and the level of $\mathbf{M}$
$>$ If it targets $\mathbf{M}$, it must allow ito adjust to equate $\mathbf{M}^{\mathbf{S}}$ and $\mathbf{M}^{\mathbf{D}}$
$>$ If it targets the rate of interest, it has to allow the money supply to change until it matches the amount of money demanded at that interest rate
- That is, the Bank of Canada can implement monetary policy by following a money supply rule or an interest rate rule
$>$ Since the late 1980s, the Bank of Canada has mostly followed an interest rate rule
